

I am opposed to the plan of BPL if the frequencies used fall in any portion of the Ham Bands. This will cause totally unnecessary interference. In an Emergency the internet will most likley fail and it is Amateur Radio that once again will come to the rescue. If we have interference on that frequency the public will pay. Make no mistake about it Amateur Radio Emergency Communications and regular Communications will be harmed in many ways. There are many systems that operate 24 hours a day 7 days a week and they will be harmed. The people who pushing this idea believe that all the RF will stay in the lines. That is Absurd any wire that long is going to radiate without question. There are many outlets presently for Internet service and I have heard of nobody who is unable to get service. What will happen to those ISPs that have invested in the present system with the hope of sales. It seems to me that the FCC should be not assisting in putting some of these other business out of business. I am sure that the Power Companies would just love to get control of one more thing. This is one idea the FCC needs to say a flat no to.

Mr. Val E. Rose
